DETAILED ACTION

Specification

1. The disclosure is objected to because of the following informalities: Paragraph 4, line 2 contains the phrase "come across". It appears this should be "occur". Paragraph 4, line 6 contains the word "voltage". It appears this should be "voltages". Paragraph 8, line 12 contains the phrase "7V and are". It appears this should be "7V, and both are". Paragraph 8, lines 15 and 28, and paragraph 9, line 14 contain the phrase "in conduct". It appears this should be "switched on". Paragraph 8, line 24 contains the phrase "OV" and are". It appears this should be "0V, and both are". Paragraph 9, line 3 contains the phrase "certain design of circuits". It appears this should be "certain circuits". Paragraph 9, line 9 contains the word "situation". It appears this should be "situations". Paragraph 9, line 15 contains the phrase "the first voltage V_{PP} the second voltage". It appears this should be "the first voltage V_{PP} and the second voltage". Paragraph 12, lines 3, 8, 10, and 11 contain the word "being". It appears this should be "is". Paragraph 12, line 4 contains the phrase "voltage, a second". It appears this should be "voltage and a second". Paragraph 21, lines 7 and 15 contain the phrase "in conduct". It appears this should be "conducting". Paragraph 21, line 13 contains the word "48are". It appears this should be "48 are". Paragraph 21, line 17 contains the phrase "voltage, because". It appears this should be "voltage. Because". Paragraph 24, lines 14-16 contain the phrase "oppositely when the ... second voltage V_{DD}". It appears this should be "oppositely when the second voltage V_{DD} is to be chosen as the power supply

voltage". Paragraph 25, lines 6-7 contain the phrase "in conduct with". It appears this should be "connected to".

Appropriate correction is required.

Drawings

2. The drawings were received on December 30, 2003. These drawings are accepted.

Claim Objections

3. Claims 1, 7, 9, 15, and 17 are objected to because of the following informalities: Claim 1, lines 3, 4, 6, 8, 9, and 11 contain the word "being". It appears this should be "is". Claim 7, line 6 contains the phrase "an junction". It appears this should be "a junction". Claim 7 lines 6-7, the phrases "the first terminal" and "the transistor" lack proper antecedent basis. Claim 9, lines 4, 5, 7, 9, 10, and 12 contain the word "being". It appears this should be "is". Claim 15 line 6, the phrase "the first terminal" lacks proper antecedent basis. Claim 15 line 7, the phrase "the transistor" lacks proper antecedent basis. Claim 17, lines 4, 5, 7, 10, 11, and 13 contain the word "being". It appears this should be "is". Appropriate correction is required.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

⁽b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

011/0011101114111b01: 10/101,01

Art Unit: 2836

5. Claims 1-7 are rejected under 35 U.S.C. 102(b) as being anticipated by the US patent of Savelli (6,133,777).

As to claim 1, Savelli, drawn to a selector circuit for the switching over of analog signals with amplitudes greater than that of the supply voltage, discloses a high voltage selecting circuit (3,4) comprising: a first transistor (3) where a first terminal of the first transistor (3) is electrically coupled to a first voltage (output of switch circuit 1), a second terminal of the first transistor (3) is electrically coupled to an output node (Vpp), and a gate of the first transistor (3) is electrically coupled to a second voltage (output of switch circuit 2); and a second transistor (4) where a first terminal of the second transistor (4) is electrically coupled to the second voltage (output of switch circuit 2), a second terminal of the second transistor (4) is electrically coupled to the output node (Vpp), and a gate of the second transistor (4) is electrically coupled to the first voltage (output of switch circuit 1); wherein the high voltage selecting circuit selectively generates an output voltage according to a higher one of the first voltage and the second voltage (see column 2, lines 43-52; column 2, line 57 through column 3, line 16; and the Figure; in the example of Savelli, one of the first and second voltages is always 0V and the other is always Vpp1 or Vpp2 (the high voltage selecting circuit 3,4 will work for any two voltages); of these, the output of the high voltage selecting circuit (3,4) is always Vpp1 or Vpp2, either of which is higher than 0V; switch circuits 1 and 2 are not part of the high voltage selecting circuit).

Art Unit: 2836

As to claim 2, the first transistor (3) is a p-type MOS transistor and the first terminal of the first transistor is a source and the second terminal of the first transistor is a drain (see column 2, lines 43-47).

As to claim 3, the second transistor (4) is a p-type MOS transistor and the first terminal of the second transistor is a source and the second terminal of the second transistor is a drain (see column 2, lines 48-52).

As to claim 4, the first transistor (3) further comprises a well and the well is electrically coupled to the second terminal of the first transistor (3) (see column 2, lines 43-47 and the Figure).

As to claim 5, the second transistor (4) further comprises a well and the well is electrically coupled to the second terminal of the second transistor (4) (see column 2, lines 48-52 and the Figure).

As to claim 6, an absolute value of a difference between the first voltage (output of switch circuit 1) and the second voltage (output of switch circuit 2) is larger than a threshold voltage of the transistors (3,4), and the output voltage (Vpp) is substantially a higher one of the first voltage and the second voltage (see column 2, lines 53-56; in the example of Savelli, since the control signals are complementary, one of the inputs to the high voltage selecting circuit in the example of Savelli will always be 0V and the other will always be either Vpp1 or Vpp2; if the absolute value of the other (Vpp1 or Vpp2) voltage is greater than the threshold voltage of the transistors (3,4), the absolute value of the difference between the other voltage and 0V will therefore be equal to the

absolute value of the other voltage and greater than the threshold voltage of the transistors (3,4)).

As to claim 7, if the absolute value of the other voltage (Vpp1 or Vpp2) is less than the threshold voltage of the transistors, the absolute value of the difference between the other voltage and 0V will be equal to the absolute value of the other voltage and therefore less than the threshold voltage of the transistors (3,4), causing both transistors (3,4) to be in the off state, and the output voltage will be the other voltage (which is higher than 0V) less a junction voltage between first terminal of its respective transistor (3,4) and the well of its respective transistor (3,4).

Claim Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 8. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of

Art Unit: 2836

the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

9. Claims 8-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Savelli in view of the US patent of Seki (5,122,692).

As to claim 8, Savelli discloses all of the claimed features, as set forth above, except for a level shifting module and a selecting switch module. Seki, drawn to a high speed level conversion circuit including a switch circuit, discloses a level shifting module (41) for inputting a voltage (V_{CC}) as a power supply of the level shifting module (41), for performing level shift on a first control signal (IN) according to the power supply voltage (V_{CC}) (see column 3, lines 41-54 and Figure 4); and a selecting switch module (42) electrically coupled to the level shifting module (41), for selectively outputting a first voltage (OUT) or a second voltage (OUT) according the level-shifted first control signal (C) (see column 3, line 55 through column 4, line 28 and Figure 4). It would have been obvious to one of ordinary skill in the art, at the time of the invention, to connect the high voltage selecting module of Savelli to the level shifting module and selecting switch module of Seki, with the output voltage (V_{CC}) of the circuit of Seki, in order to minimize power consumption and easily generate the output voltages.

Art Unit: 2836

As to claims 9-15, Savelli discloses the claimed subject matter, as set forth above.

As to claim 16, the level shifting module (41) of Savelli further performs level shift on a second control signal (IN') according to the power supply voltage and the second control signal (IN') is complementary to the first control signal (IN) (see column 3, lines 46-48).

10. Claims 17-19 rejected under 35 U.S.C. 103(a) as being unpatentable over Savelli and Seki, and further in view of admitted prior art (admission).

As to claim 17, Savelli in view of Seki disclose all of the claimed features, as set forth above, except for the selecting switch module further comprising: a third transistor where a first terminal of the third transistor is electrically coupled to a first voltage, a second terminal of the third transistor is electrically coupled to a supply node, and the gate of the third transistor is electrically coupled to a level-shifted first control signal; and a fourth transistor where a first terminal of the fourth transistor is electrically coupled to a second voltage, a second terminal of the fourth transistor is electrically coupled to the same supply node as the second terminal of the third transistor, and the gate of the fourth transistor is electrically coupled to a level-shifted second control signal.

Admitted prior art discloses a selecting switch module further comprising: a third transistor (20) where a first terminal of the third transistor (20) is electrically coupled to a first voltage (V_{PP}), a second terminal of the third transistor (20) is electrically coupled to a supply node (V_{PS}), and the gate of the third transistor (20) is electrically coupled to a level-shifted first control signal (ENVPPHV); and a fourth transistor (22) where a first

Art Unit: 2836

terminal of the fourth transistor (22) is electrically coupled to a second voltage (V_{DD}), a second terminal of the fourth transistor (22) is electrically coupled to the same supply node (V_{PS}) as the second terminal of the third transistor (20), and the gate of the fourth transistor (22)is electrically coupled to a level-shifted second control signal (ENVDDHV).

It would have been obvious to one of ordinary skill in the art, at the time of the invention, to connect the output (C) of the level shifting module of the circuit of Savelli in view of Seki to the admitted prior art selecting switch module, in order to provide a sufficiently high signal to the selecting switch module to increase reliability.

As to claim 18, the third transistor (Q_{P2}) of Savelli in view of Seki is a p-type MOS transistor and the first terminal of the third transistor (Q_{P2}) is a source and the second terminal of the third transistor (Q_{P2}) is a drain (see Seki, column 3, line 58).

As to claim 19, the fourth transistor (Q_{P1}) of Savelli in view of Seki is a p-type MOS transistor and the first terminal of the fourth transistor (Q_{P1}) is a source and the second terminal of the fourth transistor (Q_{P1}) is a drain (see Seki, column 3, lines 56-57).

Conclusion

11. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. US patents to Azami (6,567,067) and Kushnarenko (6,774,704), and the US patent application publication of Sun (2003/0222678) disclose similar modules.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hal I. Kaplan whose telephone number is 571-272-8587. The examiner can normally be reached on M-F 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Brian Sircus can be reached on 571-272-2800 x36. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
